## 2 SCPI Command Overview

SCPI (Standard Commands for Programmable Instruments) is a standardized instrument programming language that is built upon the existing standard IEEE 488.1 and IEEE 488.2 and conforms to various standards, such as the floating point operation rule in IEEE 754 standard, ISO 646 7-bit coded character set for information interchange (equivalent to ASCII programming). The SCPI commands provide a hierarchical tree structure, and consist of multiple subsystems. Each command subsystem consists of one root keyword and one or more sub-keywords.

### Syntax

The command line usually starts with a colon; the keywords are separated by colons, and following the keywords are the parameter settings available. The command ending with a quotation mark indicates querying a certain function and returns the query results. The keywords of the command and the first parameter are separated by a space.

For example,

```
:ACQuire:TYPE <type>
```

```
:ACQuire:TYPE?
```

**ACQuire** is the root keyword of the command, **TYPE** is the second-level keyword. The command line starts with a colon ":", and different levels of keywords are also separated by colons. <type> indicates a settable parameter. The command ending with a quotation mark "?" indicates querying a certain function. The command keywords **:ACQuire:TYPE** and the parameter <type> are separated by a space.

In some commands with parameters, "," is often used to separate multiple parameters. For example,

```
:SYSTem:DATE <year>,<month>,<day>
```

### Symbol Description

The following symbols are not sent with the commands.

#### 1. Braces { }

The contents in the braces can contain one or multiple parameters. These parameters can be omitted or used for several times. Parameters are usually separated by the vertical bar "|". When using the command, you must select one of the parameters.

#### 2. Vertical Bar |

The vertical bar is used to separate multiple parameters. When using the command, you must select one of the parameters.

#### 3. Square Brackets [ ]

The contents in the square brackets can be omitted.

#### 4. Angle Brackets < >

The parameter enclosed in the angle brackets must be replaced by an effective value.

### Parameter Type

#### 1. Bool

The parameter can be set to ON, OFF, 1, or 0. For example,

```
:SYSTem:BEEPer <bool>
```

```
:SYSTem:BEEPer?
```

Wherein, <bool> can be set to {{1|ON}}{0|OFF}}. The query returns 1 or 0.

#### 2. Discrete

The parameter can be any of the values listed. For example,

```
:SYSTem:PSTatus <sat>
```

```
:SYSTem:PSTatus?
```

Wherein,

- <sat> can be set to DEFault|OPEN.
- The query returns an abbreviated form: DEF or OPEN.

#### 3. Integer

Unless otherwise specified, the parameter can be any integer (NR1 format) within the effective value range.

#### CAUTION

Do not set the parameter to a decimal, otherwise, errors will occur.

For example,

```
:DISPlay:GBRrightness <brightness>
```

```
:DISPlay:GBRrightness?
```

Wherein, <brightness> can be set to an integer ranging from 1 to 100. The query returns an integer ranging from 1 to 100.

#### 4. Real

The parameter can be any real number within the effective value range, and this command accepts parameter input in decimal (NR2 format) and scientific notation (NR3 format). For example,

```
:TRIGger:TIMEout:TIME <time>
```

**:TRIGger:TIMEout:TIME?**

Wherein, *<time>* can be set to any real number ranging from 1.6E-8 (that is, 16 ns) to 1E+1 (that is, 10 s). The query returns a real number in scientific notation.

## 5. ASCII String

The parameter can be the combinations of ASCII characters. For example,

**:LAN:GATeway <string>**

Wherein, *<string>* can be set to

```
192.168.1.1
```

## Command Abbreviation

All the commands are case-insensitive. They can all be in upper case or in lower case. If abbreviation is used, you must input all the capital letters in the command. For example,

**:DISPlay:GBRightness?**

can be abbreviated to

**:DISP:GBR?**

## 3 Command System

This chapter introduces the syntax, functions, parameters, and usage of each MSO8000A command. By default, only CH1 is enabled.

### NOTE

1. Unless otherwise specified, the descriptions in this manual all take MSO8154A as an example.
2. For the parameter setting command (time, frequency, amplitude, etc.), the digital oscilloscope can only recognize the numbers, unable to recognize the unit sent together with them. The unit of the parameter is a default one. For the default units of various parameters, refer to the descriptions for the specified command.

### 3.1 :AUToscale

#### Syntax

:AUToscale

#### Description

Enables the auto setting of the waveforms. The oscilloscope will automatically adjust the vertical scale, horizontal time base, and trigger mode according to the input signal to realize optimal waveform display.

This command functions the same as the  key on the front panel.

#### Parameter

N/A

#### Remarks

- When the AUTO function is disabled, this command is invalid. For details, refer to *:SYSTem:AUToscale*.
- When the pass/fail test is enabled, the AUTO function runs normally, but the pass/fail test function is forced to be disabled.
- When the waveform recording function is enabled, the AUTO function runs normally, but the recording or playing function is forced to be disabled.

## 3.7 :ACQUIRE Commands

The **:ACQUIRE** commands are used to set the memory depth of the oscilloscope, the acquisition mode, the average times, as well as query the current sample rate.

### 3.7.1 :ACQuire:AVERages

#### Syntax

```
:ACQuire:AVERages <count>
```

```
:ACQuire:AVERages?
```

#### Description

Sets or queries the number of averages in the average acquisition mode.

#### Parameter

| Name    | Type    | Range                                                            | Default |
|---------|---------|------------------------------------------------------------------|---------|
| <count> | Integer | 2 <sup>n</sup> (n is an integer, and its range is from 1 to 16). | 2       |

#### Remarks

- You can send the *:ACQuire:TYPE* command to set the acquisition mode.
- In the average acquisition mode, greater number of averages can lower the noise and increase the vertical resolution; but will also slow the response of the displayed waveform to the waveform changes.
- The number of averages must be in the Nth power of 2. When the value is not in the Nth power of 2, a value that is smaller than the one you input and the closest to the N power-of-2 increments will be input automatically. For example, if you input 9 with the numeric keypad, the average count will be input 8 automatically.

#### Return Format

The query returns an integer ranging from 2 to 65536.

#### Example

```
:ACQuire:AVERages 128      /*Sets the average times to 128.*/
:ACQuire:AVERages?         /*The query returns 128.*/
```

### 3.7.2 :ACQuire:MDEPth

#### Syntax

```
:ACQuire:MDEPth <mdep>
```

```
:ACQuire:MDEPth?
```

**Description**

Sets or queries the memory depth of the oscilloscope (i.g. the number of waveform points that can be stored through the sampling in a single trigger). The default unit is pts.

**Parameter**

| Name   | Type     | Range                                                                                                                                                                                                 | Default |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| <mdep> | Discrete | {AUTO 1k 10k 100k 1M 10M 25M 50M 100M 125M 250M 500M 1000 10000 100000 1000000 10000000 25000000 50000000 100000000 125000000 250000000 500000000 1e3 1e4 1e5 1e6 1e7 2.5e7 5e7 1e8 1.25e8 2.5e8 5e8} | 10k     |

**Remarks**

When you select the "Auto" mode, the oscilloscope selects the memory depth automatically according to the current sample rate.

The maximum memory depth for the single channel is 500 M; the maximum memory depth for the dual-channel is 250 M; and the maximum memory depth for the four-channel is 125 M.

Modifying the memory depth will affect the sample rate. To query the current sample rate, run the *:ACQUIRE:SRATE?* command.

**Return Format**

The query returns the memory depth in scientific notation.

**Example**

```
:ACQUIRE:MDEPth 1M      /*Sets the memory depth to 1M.*/
:ACQUIRE:MDEPth?        /*The query returns 1.000E+6.*/
```

### 3.7.3 :ACQUIRE:SRATE?

**Syntax**

**:ACQUIRE:SRATE?**

**Description**

Queries the current sample rate. The default unit is Sa/s.

**Parameter**

N/A

**Remarks**

- Sample rate indicates the frequency of the signal sampling, i.g. the number of waveform points sampled per second.
- The sample rate and memory depth will change accordingly in accordance with the horizontal time base. To set the memory depth, send the `:ACQuire:MDEPth` command. To set the horizontal time base, send the `:TIMebase[:MAINj]:SCALE` command.

**Return Format**

The query returns the sample rate in scientific notation.

**Example**

```
:ACQuire:SRATe? /*The query returns 1.00000E+6.*/
```

### 3.7.4 :ACQuire:LA:MDEPth?

**Syntax**

```
:ACQuire:LA:MDEPth?
```

**Description**

Queries the current LA memory depth.

**Parameter**

N/A

**Remarks**

N/A

**Return Format**

The query returns the LA memory depth in scientific notation.

**Example**

```
:ACQuire:LA:MDEPth? /*The query returns 1.250000E+4.*/
```

### 3.7.5 :ACQuire:LA:SRATe?

**Syntax**

```
:ACQuire:LA:SRATe?
```

**Description**

Queries the current LA sample rate. The default unit is Sa/s.

**Parameter**

N/A

**Remarks**

N/A

**Return Format**

The query returns the LA sample rate in scientific notation.

**Example**

```
:ACquire:LA:SRATe? /*The query returns 1.250000E+9.*/
```

### 3.7.6 :ACquire:TYPE

**Syntax**

```
:ACquire:TYPE <type>
```

```
:ACquire:TYPE?
```

**Description**

Sets or queries the acquisition mode of the oscilloscope.

**Parameter**

| Name   | Type     | Range                              | Default |
|--------|----------|------------------------------------|---------|
| <type> | Discrete | {NORMAL PEAK AVERages HRESolution} | NORMAL  |

**Remarks**

- **NORMAL:** In this mode, the oscilloscope samples the signal at a specified fixed time interval to rebuild the waveform. For most of the waveforms, using this mode can produce the optimal display effects.
- **AVERages:** In this mode, the oscilloscope averages the waveforms from multiple samples to reduce the random noise of the input signal and improve the vertical resolution. The greater the number of averages, the lower the noises and the higher the vertical resolution. However, this will also slow the response of the waveform changes.
- **PEAK:** indicates the peak detection. In this mode, the oscilloscope samples the maximum and minimum value of the signal at the fixed sampling interval to

acquire the signal envelope or the narrow pulses that might be lost. In this mode, signal aliasing can be prevented, but the noise displayed would be larger.

- **HRESolution:** indicates high resolution. The oscilloscope will average the adjacent sample points of the sample waveform to lower the random noises of the input signals and display much more smoother waveforms. If the sample rate of the digital converter is greater than the storage rate of the acquisition memory, this mode is often adopted.

#### Return Format

**3.8.13.3 :BUS<n>:RS232:POLarity****Syntax**

**:BUS<n>:RS232:POLarity <pol>**

**:BUS<n>:RS232:POLarity?**

**Description**

Sets or queries the polarity of RS232 decoding on the specified bus.

**Parameter**

| Name  | Type     | Range               | Default  |
|-------|----------|---------------------|----------|
| <n>   | Discrete | {1 2 3 4}           | -        |
| <pol> | Discrete | {POSitive NEGative} | NEGative |

**Remarks**

- The RS232 standard uses "Negative Logic", i.g. high level is Logic 0 and low level is Logic 1. Therefore, when the parameter <pol> is set to NEGative, it indicates that the polarity is set to negative logic, i.g. Normal polarity. When the parameter <pol> is set to POSitive, it indicates that the polarity is set to positive logic, i.g. Inverted polarity.
- In the RS232 decoding, the start bit of data packet indicates when to start data transmission. It is determined by the polarity. When <pol> is set to "POSitive", the start bit is 0; when "NEGative", the start bit is 1.

### Return Format

The query returns POS or NEG.

### Example

```
:BUS1:RS232:POLarity POSitive /*Sets the polarity of RS232
decoding to POSitive.*/
:BUS1:RS232:POLarity? /*The query returns POS.*/

### Remarks

- The parameter [, <src> [, <src>]] is used to set the source of the parameter under measurement.
- If the parameter <item> is set to PERiod, FREQuency, PWIDth, NWIDth, PDUTy, NDUTy, RRDelay, RFDelay, FRDelay, FFDelay, RRPHase, RFPHase, FRPHase, or FFPHase, the range of the parameter <src> is any one of the values in {CHANnel1|CHANnel2|CHANnel3|CHANnel4|MATH1|MATH2|MATH3|MATH4}.
- If the measurement parameter is a single source, you only need to set one source. If this parameter is omitted, then the source is, by default, the one that you've selected in the last sent command  
(*:MEASure:SOURce*, *:MEASure:SETup:PSA*, or *:MEASure:SETup:DSA*).
- If the measurement parameter is a dual channel source, observe the following rules to determine the source that you've selected. That is, if the parameter <src> is omitted, the first source is, by default, the one that you've selected in the last sent command (*:MEASure:SOURce*, *:MEASure:SETup:PSA*, or *:MEASure:SETup:DSA*); the second source is, by default, the one that you've selected in the last sent command (*:MEASure:SETup:PSB* or *:MEASure:SETup:DSB*).

**Example**

```
:MEASure:SETup:MAX 95 /*Sets the upper limit of the threshold

#### Parameter

| Name  | Type     | Range | Default                                                         |
|-------|----------|-------|-----------------------------------------------------------------|
| [<n>] | Discrete | {1 2} | When omitted, by default, the operations are carried out on G1. |

#### Remarks

When you perform the "align phase" operation, the instrument will re-configure the two channels to output according to the preset frequency and phase.

For two signals whose frequencies are the same or in multiple relationship, this operation can align their phases. Assume that 1 kHz, 5 Vpp, 0° sine waveforms are output on G1, and 1 kHz, 5Vpp, 180° sine waveforms are output on GII. Use the oscilloscope to acquire the waveforms of the two channels and stably display the waveforms. It can be found that the phase deviation between the two waveforms is no longer 180°. At this time, perform the "align phase" operation and then the waveforms has a phase deviation of 180°. You do not need to adjust the start phase of the Function/Arbitrary Waveform Generator manually.

#### Return Format

N/A

#### Example

N/A

### Remarks

- This series of commands are used to select the waveform shape.  
 NOISe: noise waveform  
 PULSe: pulse waveform  
 RAMP: ramp waveform  
 SINusoid: sine waveform  
 SQUare: square waveform  
 DC: DC waveform  
 USER: arbitrary waveform
- <amp>: sets the amplitude of the specified waveform. By default, the unit is Vpp.  
 <freq>: sets the frequency of the specified waveform (this parameter is not available for Noise waveform). By default, the unit is Hz.  
 <offset>: sets the DC offset of the specified waveform. By default, the unit is  $V_{DC}$ .  
 .  
 <phase>: sets the start phase of the specified waveform (this parameter is not available for Noise waveform). By default, the unit is degree (°).
- This series of commands allow users to omit one or multiple parameters. When all the parameters are omitted, the commands only configure the specified function/arbitrary waveform generator channel to the specified waveform, without modifying the corresponding parameters.
- The four parameters <freq>, <amp>, <offset>, and <phase> should be appeared in sequence. In the command, the parameters are configured in sequence, and you are not allowed to set the latter parameter without setting the former one. For example, you cannot set the parameter <amp> directly by omitting the parameter <freq>.

### 3.33.12 :TRIGger:PATtern

### 3.33.12.1 :TRIGger:PATtern:PATtern

## Syntax

:TRIGger:PATtern:PATtern

```
< pch1>[, <pch2>[, <pch3>[, <pch4>[, <pla0>[, <pla1>[, <pla2>[, <pla3>[, <pla4>[, <pla  
5>[, <pla6>[, <pla7>[, <pla8>[, <pla9>[, <pla10>[, <pla11>[, <pla12>[, <pla13>[, <pla14  
>[, <pla15>]]]]]]]]]]]
```

:TRIGger:PATtern:PATtern?

### Description

Sets or queries the channel pattern of Pattern trigger.

### Parameter

| Name    | Type     | Range       | Default |
|---------|----------|-------------|---------|
| <pch1>  | Discrete | {H L X R F} | X       |
| <pch2>  | Discrete | {H L X R F} | X       |
| <pch3>  | Discrete | {H L X R F} | X       |
| <pch4>  | Discrete | {H L X R F} | X       |
| ...     | ...      | ...         | ...     |
| <pla15> | Discrete | {H L X R F} | X       |

### Remarks

- The parameter "<pch1> to <pch4>" sets the patterns of the analog channels "CHANnel1 to CHANnel4". The parameter "<pla0> to <pla15>" sets the patterns of the digital channels "D0 to D15".
- In the parameter range, H indicates high level (higher than the threshold level of the channel), L indicates low level (lower than the threshold level of the

channel), and X indicates omitting the channel (This channel is not used as a part of the pattern. When all the channels are set to X, the oscilloscope will not trigger.) R indicates rising edge, and F indicates falling edge.

- In the pattern, you can only specify one edge (rising edge or falling edge). If one edge item is currently defined and then another edge item is defined in another channel in the pattern, then a prompt message "Invalid input" is displayed. Then, the latter defined edge item will be replaced by X.

### Return Format

The query returns the currently set pattern of all the channels. The channels are separated by commas.

### Example

```
:TRIGger:PATtern:PATtern H,R,L,X /*Sets the patterns of "CHANnel1
to CHANnel4" to H,R,L,X.*/
:TRIGger:PATtern:PATtern? /*The query returns H,R,L,X.*/

N/A

:WAV:MODE NORMAl /*Sets the waveform reading mode to NORMAl.*/
:WAV:FORM BYTE /*Sets the return format of the waveform data to
BYTE.*/
:WAV:DATA? /*Reads the waveform data on the screen.*/
```

Procedures of reading the waveform data from the internal memory:

```
:STOP /*Sets the instrument to STOP state (you can only read the
waveform data from the internal memory when the oscilloscope is in
STOP state).*/
:WAV:SOUR CHAN1 /*Sets the channel source to CHANnel1.*/
:WAV:MODE RAW /*Sets the waveform reading mode to RAW.*/
:WAV:FORM BYTE /*Sets the return format of the waveform data to

the first waveform point.*/
:WAVeform:STOP 120000 /*Sets the stop point of waveform data
reading to the 120000th waveform point (last point).*/
```

#### Return Format

- The return format is related to the return format of the currently selected waveform data (:WAVeform:FORMat).

WORD or BYTE format: The read data format is TMC header + waveform data points + end identifier. The TMC header is in #NXXXXXX format; wherein, # is the TMC header identifier; N following # represents the length of the waveform data; the length of the waveform data points is expressed in ASCII strings, and the terminator represents the ending of communication. For example, the data read for one time is #9000001000. It indicates that 9 bytes are used to describe the data length. 000001000 indicates the length of waveform data, i.g. 1,000 bytes.

ASCIi format: The read data format is TMC header + waveform data points + end identifier. The waveform data point query returns the actual voltage value of each waveform point in scientific notation; and the voltage values are separated by commas.

- When the waveform data in the internal memory are read in batches, the waveform data returned each time might be the data in one area of the internal memory. In "WORD" or "BYTE" return format, each returned data in blocks contain the TMC data block header. Waveform data in two adjacent data blocks are consecutive.
- The figure below shows the waveform data that have been read (in BYTE format). First, select "View as hexadecimal only" from the drop-down list at the right side. Then, the waveform data that have been read are displayed in hexadecimal format. The first 11 bytes denote the "TMC data block header", and beginning from the 12th byte (8E) are the waveform data. You can convert the waveform data read to the voltage value of each point of the waveform by using the formula " $(0x8E - YORigin - YREference) \times YINcrement$ ". For the definitions of the parameters in this formula, refer to [Related Command](#).

- When the waveform data in the internal memory are read in batches, the waveform data returned each time might be the data in one area of the internal memory. In "WORD" or "BYTE" return format, each returned data in blocks contain the TMC data block header. Waveform data in two adjacent data blocks are consecutive.

## 4 Programming Examples

---

This chapter illustrates how to control the instrument by programming in LabVIEW, Visual Basic, and Visual C++. These examples are programmed based on Virtual Instrument Software Architecture (VISA) library.

### 4.1 Programming Preparations

---

Before programming, you need to prepare the following tasks:

You can log in to the RIGOL official website (<http://www.rigol.com>) to download the software. Then install the software according to the installation wizard. After Ultra Sigma is installed successfully, NI-VISA library will be completely installed automatically. In this manual, the default installation path is C:\Program Files\IVI Foundation\VISA.

In the manual, the instrument communicates with the PC via the USB interface. Connect the USB Device interface on the rear panel of the instrument to the PC by using the USB cable. After the instrument is properly connected to the PC, power on the instrument to start it.

The following parts will make a detailed introduction about the programming examples in LabVIEW, Visual Basic, and Visual C++.

### 4.2 LabVIEW Programming Example

---

**Program used in this example:** LabVIEW2010

**Function realized in this example:** reading the waveform data of CH1 on the screen.

1. Run LabVIEW, and then create a VI file named LabVIEW\_Demo.
2. Add controls and create the front panel as shown in the figure below.

3. Open the Block Diagram panel. Click **Instrument I/O > VISA**. Add the following functions: VISA Open, VISA Read, VISA Write, and VISA Close.

4. Connect the VISA resource name with the VISA Open. Then, connect the VISA resource name outputs of all the functions with the VISA resource name and connect the error output with the error input, as shown in the figure below.

5. Add string constant in the write buffer areas of the VISA Write function and input the following instructions in the figure below. Waveform data is read through the

VISA Read function which requires users to input the total number of bytes to be read. In this example, the total number of bytes of waveform data to be read is less than 2048. Use the VISA Close function to close the VISA resource after the VISA operation is finished.

6. The data format is TMC data block header + waveform data + terminator. The TMC header is in #NXXXXXX format; wherein, # is the TMC header identifier; N following # represents the the length of the waveform data; the length of the waveform data points is expressed in ASCII strings, and the terminator represents the ending of communication. For example, the data read for one time is #9000001000XXXX. It indicates that 9 bytes are used to describe the data length. 000001000 indicates the length of waveform data, i.g. 1,000 bytes. Use the following block diagram to obtain the number of bytes that the TMC header occupies. Ignore the TMC header and delete the terminator at the end of the waveform data, and transfer the waveform data to the byte data and display it on the waveform diagram controls.

The available functions used in the above block diagram as as follows:

### String Subset

Used to obtain the TMC header "#N". After obtaining the number of bytes that the TMC header occupies, ignore the data header to obtain the waveform data strings

### Scan From String

Used to obtain the waveform data length bytes

### Trim Whitespace.vi (4803)

Used to delete the terminator at the end of the waveform data

### String To Byte Array

Used to transfer waveform data strings to the byte group

7. The complete program block diagram is as shown in the figure below:

8. Select the device resource from the VISA Resource Name drop-down list and run the program.

## 4.3 Visual Basic Programming Example

**Program used in this example:** Visual Basic 6.0

**Function realized in this example:** control the on/off state of any channel.

Enter the Visual Basic 6.0 programming environment, and perform the following procedures.

1. Build a standard application program project (Standard EXE), and name it "Demo".
2. Click **Project** > **Add Module** to open the Add Module dialog box. In the dialog box, click the Existing tab to search for the **visa32.bas** file in the include folder under the NI-VISA installation path and add the file.

3. In the Demo dialog box, add four buttons to represent CH1 to CH4 respectively. Add four Labels (Label1(0), Label1(1), Label1(2), Label1(3)) to represent the statuses of CH1 to CH4 respectively (when the channel is enabled, it displays the color of the channel; when the channel is disabled, it displays gray), as shown in the figure below.

4. Click **Project > Project1 Properties** to open the Project1 – Project Properties dialog box. In the dialog box, click on the General tab and select **Form1** from the drop-down list under Startup Object.
5. Double-click CH1 to enter the programming environment. Add the following codes to control CH1-CH4. The codes of CH1 are as shown below; the codes of the other channels are similar.

```
Dim defrm As Long
Dim vi As Long
Dim strRes As String * 200
Dim list As Long
Dim nmatches As Long
Dim matches As String * 200 'Reserve the obtained device number
Dim s32Disp As Integer
' Obtain the usb resource of visa
Call viOpenDefaultRM(defrm)
Call viFindRsrc(defrm, "USB?*", list, nmatches, matches)
' Turn on the instrument
Call viOpen(defrm, matches, 0, 0, vi)
```

```

' Send a command to query the status of CH1
Call viVPrintf(vi, ":CHAN1:DISP?" + Chr$(10), 0)
' Obtain the status of CH1
Call viVScanf(vi, "%t", strRes)
s32Disp = CInt(strRes)
If (s32Disp = 1) Then
' Send the setting command
Call viVPrintf(vi, ":CHAN1:DISP 0" + Chr$(10), 0)
Label1(0).ForeColor = &H808080 'Gray
Else
Call viVPrintf(vi, ":CHAN1:DISP 1" + Chr$(10), 0)
Label1(0).ForeColor = &HFFFF& 'Yellow
End If
' Close the resource
Call viClose(vi)
Call viClose(defrm)

```

6. Save and run the project to obtain a single exe program for demo. When the instrument is correctly connected to the PC, you can control the on/off status of any channel.

## 4.4 Visual C++ Programming Example

**Program used in this example:** Visual C++ 6.0

**Function realized in this example:** search for the instrument address, connect to the instrument, send commands, and read return values.

Enter the Visual C++ 6.0 programming environment, and perform the following procedures.

1. Create a MFC project based on a dialog box.
2. Click **Project > Settings** to open the **Project Setting** dialog box. In the dialog box, click the **C/C++** tab, select **Code Generation** from the drop-down list under **Category**. Choose **Debug Multithreaded DLL** from the drop-down list under **Use run-time library**. Click **OK** to close the dialog box.

3. Click **Project** > **Settings** to open the **Project Setting** dialog box. In the dialog box, click the **Link** tab, add "visa32.lib" under **Object/library modules**, then click **OK** to close the dialog box.

4. Click **Tools** > **Options** to open the Options dialog box. Then click the **Directories** tab.

Select **Include files** from the drop-down list under **Show directories for**. Double click the empty space under **Directories** to enter the specified path of Include files: C:\Program Files\IVI Foundation\VISA\WinNT\include. Click **OK** to close the dialog box.

Select **Library files** from the drop-down list under **Show directories for**. Double click the empty space under **Directories** to enter the specified path of Library files: C:\Program Files\IVI Foundation\VISA\WinNT\lib\msc. Click **OK** to close the dialog box.

Note: By now, VISA library has been added.

5. Add the **Text**, **Combo Box**, **Button**, and **Edit Box** controls. The layout interface for adding controls is as follows:

6. Modify the control attributes.
  - a. Name **Text** as "Command".
  - b. Open the **Data** item in the **Combo Box** attribute and input the following command \*IDN? manually.
  - c. Open the **General** item in the **Edit Box** attribute and select **Disabled**.
  - d. Name **Button** as **Send and Read**.

7. Add the variables `m_combox` and `m_receive` to the **Com Box** and **Edit Box** controls respectively.

8. Add codes.

Double-click **Send and Read** to enter the programming environment. Declare the `#include <visa.h>` of the VISA library in the header file and then add the following codes:

```
ViSession defaultRM, vi;
char buf [256] = {0};
CString s, strTemp;
char* stringTemp;

ViChar buffer [VI_FIND_BUFLLEN];
```

```
ViRsrc matches="buffer";
ViUInt32 nmatches;
ViFindList list;

viOpenDefaultRM (&defaultRM);
//Acquire the USB resource of VISA
viFindRsrc(defaultRM, "USB?*", &list,&nmatches, matches);
viOpen (defaultRM,matches,VI_NULL,VI_NULL,&vi);

//Send the command received
m_combox.GetLBText(m_combox.GetCurSel(),strTemp);
strTemp = strTemp + "\n";
stringTemp = (char *) (LPCTSTR)strTemp;
viPrintf (vi,stringTemp);

//Read the results
viScanf (vi, "%t\n", &buf);

//Display the results
UpdateData (TRUE);
m_receive = buf;
UpdateData (FALSE);
viClose (vi);
viClose (defaultRM);
```

9. Save, compile, and run the project to obtain a single exe file. When the instrument is correctly connected to the PC, enter a command (for example, \*IDN?) and click **Send and Read** to execute the command. Then, the reading results will be returned.
